Deploying to GitLab Pages (on each push)

<> **deployment_to_gitlab_pages.md**

(assuming project is hosted on GitLab)

1. Enable shared runners by going to "Settings" > "Runners".
2. Add `.gitlab-ci.yml` with the following content:

```
image: node:6.9.1
pages:
  artifacts:
    paths:
      - build
  cache:
    paths:
      - .yarn-cache/
  only:
    - master
  script:
    - curl -o- -L https://yarnpkg.com/install.sh | bash -s -- --version 0.19.1
    - export PATH="$HOME/.yarn/bin:$PATH"
    - yarn config set cache-folder $(pwd)/.yarn-cache
    - yarn install
    - yarn build
  stage: deploy
```

Your website will be available at `https://username.gitlab.io/projectname`.
If you want the URL to look like `https://username.gitlab.io`, go to your project's Settings and rename your project to `username.gitlab.io`.

To learn more about GitLab Pages go to https://pages.gitlab.io (official documentation available at http://doc.gitlab.com/ee/pages/README.html).
